

TIMBER SERVICE-LIFE DESIGN PACKAGE ~ ORDER FORM

Now available! A design guide that helps builders and architects select timber and timber treatments best suited to specific local conditions.

Using the **Timber Service life design package** will help you improve the safety and performance of timber in construction. The Guide and accompanying software use structural engineering criteria and predictive modelling to assess how long timbers used in Australia will last, taking into account natural variation between timber species, the effectiveness of timber treatments and climatic conditions.

Geographic risk zones for 80 timber species have been identified. The species have been rated for their durability when exposed to in-ground decay fungi, above-ground decay fungi, marine borers, subterranean termites. Even the corrosion of fastener systems is taken into account.

The **Timber Service-life Design Guide** and accompanying **Timberlife** software are the result of a ten-year collaboration between scientists at CSIRO, state forestry agencies and the timber industry.
